## ABSTRACT

2 A restraint for application to an extremity of a wearer instead of metal or plastic cuffs.  
3 The device has a main body and a series of bands, which bands overlay a transversely disposed  
4 webbing section and extend beyond the body portion. The body is formed of two layers, a tough  
5 upper layer of canvas or similar material and a soft bottom layer such as velour that makes skin  
6 contact. The body is generally rectangular and preferably has an oblique inner edge that connects  
7 the parallel upper and lower edges. Bands of hook and pile closure are disposed along the width  
8 of the body between the outer edge and the preferably oblique edge and extend an equal amount  
9 beyond the body. These bands have pile disposed away from the body, and the band part that  
10 extends beyond the body has a pile layer obverse side and a hook layer reverse side.
